

Checklist

What you should know

By the end of this subtopic you should be able to:

- understand the connection between differentiation and anti-differentiation
- understand the notation $\int f(x)dx$ for the indefinite integral (anti-derivative)
- work out anti-derivatives of functions of the form $f(x) = ax^n$ where $n \neq -1$ is an integer, and of sums and differences of this type of function
- understand the importance of the added constant in the indefinite integral and work out its value from a boundary condition
- understand the concept of a definite integral and be familiar with the notation
$$\int_a^b f(x)dx$$
- recognise the similarity in the notation for indefinite and definite integrals
- find definite integrals using technology
- appreciate the connection between a definite integral and the areas of a region bounded by the x -axis and the graph of a function.
